Diversity of wild plants in a low-maintenance Scottish suburban garden. Then and now – 1986 and 2011

In 1986, prior to the publication of the Wild Plants of Glasgow (Dickson, 1991), a survey was undertaken of the native (or naturalised) higher plant diversity of a large suburban garden in the south side of Glasgow. The garden harboured over sixty wild plant species, including a few unusual species for the area. A follow up survey was undertaken 25 years later in 2011, to assess how the natural plant eommunity had changed over the years. Plants were identified with the aid of Keble Martin (1969), Garrard & Streeter (1983), and Phillips (1980). Nomenclature has been updated to match Dickson *et al.* (2000).

The garden located on Newark Drive in Pollokshields (NS 57225 63075) is moderately large with a footprint of around 1200m². The layout comprises, to the front, a gravel driveway and a lawn with bordering beds with a few shrubs and mature trees (lime, norway maple, sycamore, horse chestnut, holly, common whitebeam, laburnum and wych elm) (see Fig.1). The side gardens have an old concrete drive, grass areas, gravel paths and small trees (ash, rowan, silver bireh, locust tree) (see Fig.2) and the rear garden has more extensive grass areas, a concrete garage forecourt, some overgrown beds, a former vegetable garden and a few mature trees (lime, alder, wild cherry and apple) (see Fig.3). The garden was intensively cultivated in the 1960s with many formal beds of flowers, neat lawns, pollarded trees, vegetable patches as well as a large greenhouse and numerous exterior cold frames. From the early 1970s the eultivation regime reduced rapidly to a low maintenance level. Tree pruning ceased, the greenhouse was dismantled, and many beds and vegetable patches were converted to grass or simply became overgrown with weeds. Lawn mowing continued but bed weeding was minimal, limited to removal of large saplings with only shrubs and some hardy perennial garden flowers persisting. The front driveway was maintained with occasional weeding or application of weed killer but the concrete drive and forecourt and other paths gradually became overgrown with grass and weeds.

The initial survey in 1986 recorded 51 species of native (or naturalised) flowering plants, five fern species and one horsetail (Table 1). Grasses added another, often

hidden, component of higher plant diversity. Mowing and strimming often limited grass identification but during the early 1980s ten species of grass (and one rush) were identified within the garden (Table 2). The flowering plants included a variety of annual weeds (eg. thale cress, cleavers, groundsel) and several pernicious perennial "weeds" - the bane of gardeners rosebay willowherb, ground-elder, field horsetail, large bindweed, japanese knotweed. The grassy areas had their own distinctive flora including creeping thyme-leaved daisy, self-heal, and buttercup, speedwell. A few shade tolerant woodland species such as lesser celandine, broad-leaved helleborine and bluebell were already present under mature trees.

Some species were elearly garden escapes (ie. welsh poppy, feverfew) and others, although indigenous to Scotland, are known to have been intentional introductions into the garden in the 1970s: shining crane's-bill from Lennoxtown, barren strawberry from Reservoir, water avens from Dalry (Ayrshire), great mullein from Dumfries, eaper spurge from the derelict greenhouse of a neighbouring garden, and bluebell from Pollok Park. Others may have previously arrived with soil from greenhouse plants. This is probably the case (indirectly) for the caper spurge mentioned above and for the greater burnetsaxifrage which appeared in the early 1980s in the area of the dismantled greenhouse. The eaper spurge was introduced in 1974 and persisted by self seeding around the garden for around 12 years. It is rare in the Glasgow area, being recorded from only four tetrads (Dickson et al. 2000). The greater burnet-saxifrage appeared as a seedling in 1981 and comprised four large plants by 1986. It is very rare in Scotland and this was the first record for the Glasgow area (Dickson et al. 2000).

Aecidental introduction of some plants with commercial grass seed mix during conversion of some former flower beds into lawns was also a known arrival route into the garden for at least three unusual species black nightshade (*Solanum nigrum*) in 1978), small-flowered catchfly (*Silene gallica*) in 1980, and field madder (*Sherardia arvensis*) in 1981– but none of these persisted into the following years.

Four species of fern were present in 1986. Male-fern and lady-fern were scattered throughout the garden. There were three broad buckler-fern plants – introduced from Pollok Park and on the garden walls a single hard shield-fern and a single maidenhair spleenwort.

The follow-up survey in 2011 revealed that the number of wild flower species established in the garden had increased to 60 and the number of fern species remained the same at five. Some flower species (e.g. barren strawberry, germander speedwell, self-heal, bluebell) have spread and increased in abundance, others have decreased (e.g. red campion, american willowherb, daisy, feverfew). Altogether nine flower species and two ferns have disappeared and 18 new flower species and two new ferns have arrived. Mowing and strimming prevented a proper review of the grass species in 2011.

In addition to the flowering plants and ferns found in 2011, a large number of tree (or shrub) seedlings or saplings were noted sprouting on lawns and old border beds (Table 3). In spring 2011 nearly thirty lime seedlings (cotyledon stage) were observed on the lawn areas. Regeneration of lime is relatively unusual in Scotland (see Gray, Grist, & Hansen 1999).

Among the absentees in 2011 were several annual weeds (shepherd's purse, groundsel, and common orache) possibly edged out by overgrowth of grasses and thickets of bramble in some areas. Newly arrived weeds included ivy-leaved speedwell, knotgrass, smooth sow-thistle, curled dock, common nettle, great willowherb and bramble. Another new weed, blinks, formed extensive patches on the gravel driveway. The introduced water avens, greater burnet-saxifrage, great mullein, and caper spurge have all died out along with the single bittersweet. The arrival of the two-spined acaena is of interest (Fig.4). Although this alien species is still rare as a naturalised plant in Glasgow it may be spreading.

In the grassy areas greater plantain seems to have disappeared while a few ribwort plantain have arrived. The alien fox-and-cubs ("orange hawkweed") has invaded the front lawn and, with a low growth habit resistant to mowing, has become exceedingly abundant and a garden variety of lady's mantle has turned up on a grassed over driveway. Several cuckooflower have also appeared in recent years in the grassy areas although these are more susceptible to mowing and flowering stalks persist only on untrimmed grassy borders.

The continued growth of mature (and maturing) trees has encouraged the development of a woodland flora under their shade. Lesser celandine has expanded from a few patches to broad carpets. The dozen or so native bluebell introduced in the eighties have now formed into two natural "bluebell glades" with over 150 plants. However non-native spanish bluebell has also spread

from neighbouring gardens and it appears that they may already be hybridising with the native bluebell (see Dickson, 1991, Diekson *et al.* 2000). Four new shade-tolerant woodland species have colonised the garden; wood avens and wild strawberry, both of which are already widespread, a patch of enchanter's nightshade, and a single flowering plant of ramsons.

Among the ferns the broad buckler-fern and hard shield-fern have gone but the shade loving hart's-tongue has arrived. The single maidenhair spleenwort on the garden wall has expanded to over 100 plants and a few plants of wall-rue have established on the same wall, spread from a new colony of about 50 plants on an adjacent neighbour's wall.

Gardens are often overlooked when it comes to surveys of natural flora. It is evident from the small number examined in preparation for the Wild Plants of Glasgow (Dickson, 1991) that suburban gardens, especially if a little unkempt, can host a surprising diversity of natural flora. In well cultivated gardens the natural flora will be dominated by plants of arable land (*i.e.* weeds of flower beds) or grazed pasture (*i.e.* weeds of lawns) but where the maintenance is less strict and where trees are allowed to mature then woodland species may become established.

Aecidental introduction from horticulture via grass seeding, flower seed packs or potted plants from garden centres may result in the presence of some unexpected native species. At Newark Drive accidental (or intentional) introduction has been the source of several such arrivals. Mud on tyre treads or wheel arches may possibly explain the spread of some driveway weeds such as blinks and knotgrass. Most of the other plant arrivals probably derive from windblown seeds (or spores). This is undoubtedly the ease for most weed species, for broad-leaved helleborine orchids, and for fern species. Others such as bramble and wild strawberries may arrive as seeds within bird droppings. Wood avens and enchanter's nightshade with barbed seeds may perhaps arrive attached to bird's feathers or on the fur of foxes or cats. The spread of the alien two-spined aeaena is likely to be similar.

Colonisation by tree seedlings is mainly by wind blown seeds from near and far. Two goat willow saplings noted in 2011 were growing in the house roof gutter, 8m above ground, on a bed of pigeon droppings! Although only about 30 cm tall they were already reproducing with catkins. Other trees which produce berries (rowan, whitebeam, hawthorn, wild cherry, holly and elder) may be spread via bird droppings. There is evidence in the form of gnawed cherry stones secreted in holes that mice may also help distribute the wild cherry, while grey squirrels (rare in this area in the 1980s but now common) are a possible eandidate for distribution of horse chestnuts.

Species		1986 status	2011 status
creeping buttercup	Ranunculus repens	common	common
meadow buttercup	Ranunculus acris	one plant	one plant
lesser celandine	Ranunculus ficaria	several patches	abundant
welsh poppy	Meconopsis cambrica	common	common
wavy bitter cress	Cardamine flexuosa	common	common
cuckooflower	Cardamine pratensis	absent	five plants
shepherd's-purse	Capsella bursa-pastoris	a few on paths	absent
thale cress	Arabidopsis thaliana	common	common
red campion	Silene dioica	common	one plant
common mouse-ear	Cerastium fontanum	one patch on lawn	several on lawn
olinks	Montia fontana	absent	abundant
procumbent pearlwort	Sagina procumbens	common on paths	a few on paths
nerb-robert	Geranium robertianum	common	common
hining crane's-bill	Geranium lucidum	common	common
white clover	Trifolium repens	common on lawn	common on lawn
oush vetch	Vicia sepium	one large patch	four patches
ady's mantle	Alchemilla mollis	absent	three plants
wo-spined acaena	Acaena ovalifolia	absent	one plant
oramble	Rubus fruticosus s.l.	absent	abundant
arren strawberry	Potentilla sterilis	five plants	common
vild strawberry	Fragraria vesca	absent	common
vaters avens	Geum rivale	15 plants	absent
vood avens	Geum urbanum	absent	common
osebay willowherb	Chamerion angustifolium	several stands	two stands
road-leaved willowherb	Epilobium montanum	common	common
merican willowherb	Epilobium ciliatum	30 plants	one plant
reat willowherb	Epilobium hirsutum	absent	two stands
round-elder	Aegopodium podagraria	abundant	abundant
reater burnet-saxifrage	Pimpinella major	four plants	absent
oignut	Conopodium majus	one on grass	one on grass
nchanter's nightshade	Circaea lutetiana	absent	twenty plants
common ivy	Hedera helix	several on walls	common
leavers	Galium aparine	common	common
aisy	Bellis perennis	common on lawns	a few on lawns
everfew	Tanacetum parthenium	common	
roundsel	Senecio vulgaris		two plants
		common	absent
ommon ragwort reeping thistle	Senecio jacobaea	several	common
	Cirsium arvense	common	four plants
pear thistle at's-ear	Cirsium vulgare	common	two plants
ommon hawkweed	Hypochaeris radicata	several on lawn	common on lawn
	Hieraceum vulgatum	a few on grass	three plants
ox-and-cubs	Pilosella aurantiaca	absent	abundant on lawn
andelion mooth sow-thistle	Taraxacum sp.	common	common
	Sonchus oleraceus	absent	two plants
ipplewort	Lapsana communis	common	common
ield forget-me-not	Myosotis arvensis	common on paths	six plants
arge bindweed	Calystegia silvatica	common	common
ittersweet	Solanum dulcamara	one plant	absent
reat mullein	Verbascum thapsus	one plant	absent
y-leaved toadflax	Cymbalaria muralis	common on walls	common on walls
oxglove	Digitalis purpurea	common	five plants
vy-leaved speedwell	Veronica hederifolia	absent	three on drive
hyme-leaved speedwell	Veronica serpyllifolia	common on grass	common on grass
ermander speedwell	Veronica chamaedrys	a few on grass border	abundant on grass border
elfheal	Prunella vulgaris	one patch	common
reater plantain	Plantago major	a few on grass	absent
ibwort plantain	Plantago lanceolata	absent	three on grass

eommon orache	Atriplex patula	a few on paths	absent
knotgrass	Polygonum aviculare	absent	ten plants on drive
japanese knotweed	Fallopia japonica	eommon	eommon
eommon sorrel	Rumex acetosa	eommon on grass	a few on grass
broad-leaved doek	Rumex obtusifolius	eommon	eommon
eurled dock	Rumex crispus	absent	one plant
eaper spurge	Euphorbia lathyris	one plant	absent
eommon nettle	Urtica dioica	absent	one small patch
broad-leaved helleborine	Epipactis helleborine	four under trees	nine under trees
ramsons	Allium ursinum	absent	one under trees
bluebell	Hyacinthoides non-scriptus	twelve under trees	eommon
spanish bluebell	Hyacinthoides hispanica	absent	several elumps
male-fern	Dryopteris filix-mas	several	several
broad buckler-fern	Dryopteris dilitata	three plants	absent
lady-fern	Athyrium filix-femina	several	several
hard shield-fern	Polystichum aculeatum	one on wall	absent
hart's-tongue	Asplenium scolopendrium	absent	several
wall-rue	Asplenium ruta-muraria	absent	five on wall
maidenhair spleenwort	Asplenium trichomanes	one on wall	abundant on wall
field horsetail	Equisetum arvense	eommon	eommon

Table 1. Wild (and naturalised) flowers and ferns 1986 and 2011.

It is clear from the relative abundances of the tree seedlings and saplings that, left to itself, this suburban garden would quickly revert to deciduous woodland dominated by syeamore and norway maple, neither of which is native to Scotland (Dickson *et al.* 2000), with an under-storey of shade-tolerant woodland plants.

ACKNOWLEDGMENTS

Thanks are due to Alison Moss and Damien Hieks for assistance with some plant identifications.

Fig.2. Newark Drive - Grassed over concrete driveway.

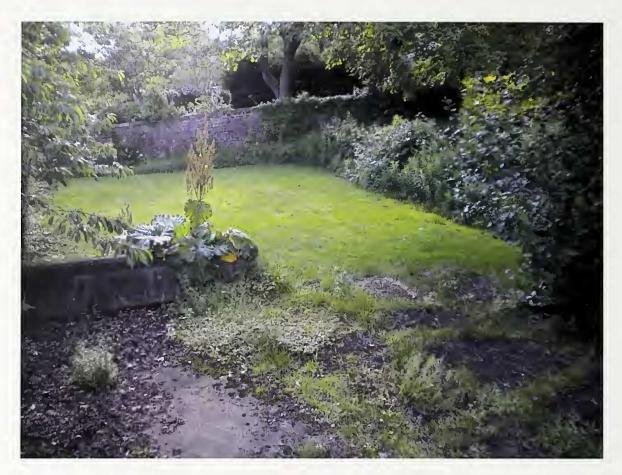

Fig.3. Newark Drive - Rear garden.

Fig.4. Newark Drive - Two-spined acaena.

Species	
red fescue	Festuca rubra
perennial rye-grass	Lolium perenne
crested dog's-tail	Cynosurus cristatus
annual meadow-grass	Poa annua
cock's-foot	Dactylis glomerata
yorkshire-fog	Holcus lanatus
sweet vernal-grass	Anthoxantlium oderatum
reed canary-grass	Phalaris arundinacea
timothy	Phleum pratense
common couch	Elytrigia repens
field wood-rush	Luzula campestris

Table 2. Grass and rush species in the 1980s.

Species		No. of seedlings/saplings
wych clm	Ulmus glabra	1
silver birch	Betula pendula	3
alder	Alnus glutinosa	6
lime	Tilia x europaea	27
goat willow	Salix caprea	3
wild cherry	Prunus avium	10
cherry laural	Prunus laurocerasus	6
rowan	Sorbus aucuparia	5
common whitebeam	Sorbus aria	1
hawthorn	Crataegus monogyna	3
broom	Cytisus scoparius	1
holly	Ilex aquifolium	4
horse chestnut	Aesculus hippocastanum	10
norway maple	Acer platanoides	100s
sycamore	Acer pseudoplatanus	100s
ash	Fraxinus excelsior	3
elder	Sambucus nigra	2

Table 3. Tree (and shrub) seedlings and saplings in 2011.
